Student Survey Analysis

This was based on the mid-course feedback surveys and was mainly focused on understanding what seems to drive positive outcomes for students beyond simply whether they enjoyed the course or not.

Some of the main takeaways were:

- Instructor quality and accessibility appeared to be some of the strongest drivers of student satisfaction.
- Students who felt comfortable asking questions generally also reported larger increases in confidence throughout the course.
- Open-ended responses frequently mentioned wanting more projects, practical assignments, and real-world examples.
- The results seemed to align quite well with the direction Ilmhona is already moving in around more applied and project-based learning.

Potential website uses:

- Student experience section
- Learning philosophy
- Continuous improvement / feedback culture

Course Portfolio Analysis

This project combined several different factors, such as enrollment, student progress, employment outcomes, gender participation, future labor market demand, and cost efficiency, into a single framework for evaluating program impact.

A few findings that stood out:

- Programming courses performed particularly strongly due to their employment outcomes and alignment with future labor market trends.
- Digital Literacy and ICT had some of the largest reach and accessibility impacts, even if employment outcomes were naturally lower.
- Introductory technical courses seemed to function as important pipeline programs that feed students into more advanced tracks.
- Some creative programs may benefit from stronger employer or freelance pathways.

Potential website uses:

- Impact metrics
- Program outcomes
- Data-driven curriculum design

Central Asia Technology and Labor Market Research

I also spent some time looking at broader workforce trends across Central Asia to better understand where demand appears to be heading over the next several years and how Ilmhona's programs align with those trends.

Some of the more interesting findings:

- According to World Bank research, workers with advanced digital skills earn wage premiums approaching 50% across Europe and Central Asia.
- The strongest projected growth areas appear to be AI, data analytics, cybersecurity, software development, and product-related roles.
- Analytical thinking, communication, and adaptability increasingly appear alongside technical skills in employer surveys.
- Governments throughout Central Asia are investing heavily in digital transformation and AI readiness.
- Remote work is increasingly allowing workers in countries like Tajikistan to access international opportunities without leaving the country.

One thing I found particularly interesting was how closely many of these trends already align with the direction Ilmhona appears to be moving in. Programming, AI, digital literacy, entrepreneurship, and project-based learning all appeared repeatedly across labor market forecasts, employer surveys, and successful organizations operating elsewhere in the region.

Potential website uses:

- Future skills section
- "Why these programs?" section
- AI-native vision and future direction
- Blog or insights content focused on the future of work in Central Asia

Benchmarking Similar Organizations

I looked at several organizations doing similar work elsewhere in the region to understand how they are evolving and where Ilmhona might differentiate itself.

A few examples:

- Astana Hub in Kazakhstan now supports over 1,600 technology companies and more than 32,000 jobs.
- IT Park Uzbekistan has experienced extremely rapid growth in technology exports over the last several years.
- Many organizations appear to be shifting toward AI, entrepreneurship, and project-based learning alongside traditional technical training.

Potential website uses:

- Positioning Ilmhona within the broader regional ecosystem
- Long-term vision and strategy

Fundraising and Partnership Analysis

The fundraising work produced some interesting patterns as well.

A few observations:

- Most funding for organizations like Ilmhona appears to come from multilaterals, bilateral donors, foundations, and corporate philanthropy programs.
- Corporate technology partnerships stood out as an area that may have additional potential moving forward.
- Partnerships could potentially extend beyond grants into equipment donations, software licenses, cloud credits, certifications, mentorship programs, and internship pathways.

Potential website uses:

- Partnership page
- Supporters and collaborators section
- Future growth initiatives

For the website specifically, my initial thought was that the strongest candidates would probably be:

- student impact metrics,
- geographic reach,
- labor market trends,
- future skills demand,
- graduate outcomes,
- and the reasoning behind where Ilmhona's programs are heading in the future.

Projections

One other thing I thought might be interesting for the website is incorporating some of the broader trends into a section around where Ilmhona is heading as an organization over the next several years. Based on the labor market research, benchmarking work, and internal program analysis, the direction seems to point toward a greater emphasis on AI, analytics, project-based learning, remote work opportunities, and stronger employer and technology partnerships. Looking at organizations like Astana Hub, IT Park Uzbekistan, and TUMO, there also seems to be a broader regional shift toward combining technical skills with entrepreneurship, applied projects, and AI-enabled work. It felt like some of this could help communicate not only what Ilmhona currently does, but the role it hopes to play in shaping the future digital workforce of Tajikistan and Central Asia more broadly.

Obviously not everything here belongs on a public-facing website, but I figured I would send everything over so we can decide what might be useful.

Best,
Chima
